

Arrays, Linked Lists

Exam-Level 02

Example Agenda

- 1:10 - 1:15 ~ announcements
- 1:15 - 1:30 ~ content review
- 1:30 - 1:40 ~ question 1
- 1:40 - 1:55 ~ question 2
- Question 3 if time

Announcements

Sunday	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
	2/3 Week 3 Survey Due Mini-Project 0 Due		2/5 Project Party @ Woz!		2/7 Homework 1 Due Lab 3 Due	
	2/10 Week 4 Survey Due Project 1A Due				2/14 Lab 4 Due	

Content Review

GRoE: Golden Rule of Equals

“Given variables `y` and `x`:
`y = x` copies all the bits from `x` into `y`.”

Java is **pass-by-value**: when you call a function and give it some arguments, the function called receives an exact copy of those arguments, tied to its own local variables.

“Copies all the bits” means different things for **primitive vs. reference types**.

Primitive vs. Reference Types

- **Primitive Types** are represented by a certain number of bytes stored at the location of the variable in memory. There are only 8 in Java.

Examples: byte, short, int, long, float, double, boolean, char

- **Reference Types** are represented by a memory address stored at the location of the variable which points to where the full object is (all objects are stored at addresses in memory). This memory address is often referred to as a *pointer*.

Examples: Strings, Arrays, Linked Lists, Dogs, etc.

Back to the GRoE

“Given variables `y` and `x`:
`y = x` copies all the bits from `x` into `y`.”

- The value of a primitive type gets copied directly upon variable assignment
 - Ex. `int x = 5;` means that variable `x` stores the value of 5
- The value of a reference type is a “shallow” copy upon variable assignment: the pointer (memory address) is copied, and the object itself in memory is not
 - Exception: `null` is a special pointer that we compare with `==`

A Quick Example

```
int x = 5;  
int[] arr = new int[]{1, 2, 3, 5};
```

A Quick Example

```
int x = 5;  
int[] arr = new int[]{1, 2, 3, 5};  
doSomething(x, arr);  
...
```

```
public void doSomething(int y, int[] other) {  
    y = 9;  
    other[2] = 4;  
}
```

Static vs. Instance, Revisited

Static variables and functions belong to the whole class.

Example: Every 61B Student shares the same professor, and if the professor were to change it would change for everyone.

Instance variables and functions belong to each individual instance.

Example: Each 61B Student has their own ID number, and changing a student's ID number doesn't change anything for any other student.

this vs. static

- `this`
 - Non-static methods can only be called using an instance of that object, so during evaluation of that function, you will always have access to this instance of the object, referred to as `this`
- static methods
 - do not require an instance of that object in order to be called, so during evaluation of that function, you cannot rely on access to this instance of the object
- static variables
 - shared by all instances of the class; each instance does not get its own copy but can access
- Check for understanding: can you reference `this` in static methods? Can you reference static variables in instance methods? Why or why not?

Arrays

Arrays are data structures that can only hold elements of the same (primitive or reference) type of value. `arr[i]` holds a value in the *i*th position of the array (zero-indexed). We can also have n-dimensional arrays (ie. `int[][] a = new int[3][2];` you can index into these like `a[2][1]`)

Arrays have a set length when instantiated, so they cannot be extended / shortened with pointers like a Linked List. To resize, we need to copy over all elements to a new array (ie. `System.arraycopy`)

Linked Lists

Linked Lists are modular lists that are made up of nodes that each contain a value and a pointer to the next node. To access values in a Linked List, you must use dot notation.

Example: `intList.get(2)`

- Can be extended or shortened by changing the pointers of its nodes (unlike arrays)
- Can't be indexed directly into like an array: instead, the computer has to iterate through all of the nodes up to that point and follow their next pointers
- A **sentinel** is a special type of node that is often used as an empty placeholder for ease of adding / deleting nodes, especially from the front or back of the Linked List
 - In a circular doubly-linked implementation, the sentinel's `next` and `prev` pointers are the first and last nodes respectively

Worksheet

1 Boxes and Pointers

```
1 IntList L1 = IntList.list(1, 2, 3);  
2 IntList L2 = new IntList(4, L1.rest);  
3 L2.rest.first = 13;  
4 L1.rest.rest.rest = L2;  
5 IntList L3 = IntList.list(50);  
6 L2.rest.rest = L3;
```

1 Boxes and Pointers

```
1  IntList L1 = IntList.list(1, 2, 3);  
2  IntList L2 = new IntList(4,  
   L1.rest);  
3  L2.rest.first = 13;  
4  L1.rest.rest.rest = L2;  
5  IntList L3 = IntList.list(50);  
6  L2.rest.rest = L3;
```

1 Boxes and Pointers

```
1  IntList L1 = IntList.list(1, 2, 3);  
2  IntList L2 = new IntList(4,  
   L1.rest);  
3  L2.rest.first = 13;  
4  L1.rest.rest.rest = L2;  
5  IntList L3 = IntList.list(50);  
6  L2.rest.rest = L3;
```

1 Boxes and Pointers

```
1 IntList L1 = IntList.list(1, 2, 3);  
2 IntList L2 = new IntList(4,  
  L1.rest);  
3 L2.rest.first = 13;  
4 L1.rest.rest.rest = L2;  
5 IntList L3 = IntList.list(50);  
6 L2.rest.rest = L3;
```

1 Boxes and Pointers

```
1 IntList L1 = IntList.list(1, 2, 3);  
2 IntList L2 = new IntList(4,  
  L1.rest);  
3 L2.rest.first = 13;  
4 L1.rest.rest.rest = L2;  
5 IntList L3 = IntList.list(50);  
6 L2.rest.rest = L3;
```

1 Boxes and Pointers

```
1 IntList L1 = IntList.list(1, 2, 3);  
2 IntList L2 = new IntList(4,  
  L1.rest);  
3 L2.rest.first = 13;  
4 L1.rest.rest.rest = L2;  
5 IntList L3 = IntList.list(50);  
6 L2.rest.rest = L3;
```

1 Boxes and Pointers

```
1  IntList L1 = IntList.list(1, 2, 3);  
2  IntList L2 = new IntList(4,  
  L1.rest);  
3  L2.rest.first = 13;  
4  L1.rest.rest.rest = L2;  
5  IntList L3 = IntList.list(50);  
6  L2.rest.rest = L3;
```

2 Interweave

Implement `interweave`, which takes in an `IntList lst` and an integer `k`, and **destructively** interweaves `lst` into `k` `IntList`s such that each list has the following properties:

- It is the same length as the other lists. You may assume it is evenly divisible.
- Its ordering is consistent with the ordering of `lst`.

These lists should be put in an array of length `k`, and this array should be returned.

For instance, if `lst=[6, 5, 4, 3, 2, 1]`, and `k=2`, then you return an array of 2 linked lists, the first one `[6, 4, 2]`, and the second one `[5, 3, 1]`.

Destructively: instead of creating new `IntList` instances, you should focus on modifying the pointers in the existing `IntList`, `lst`.

2 Interweave

```
public static IntList[] interweave(IntList lst, int k) {
    IntList[] array = new IntList[k];
    int index = k - 1;
    IntList L = reverse(lst); // Assume reverse is implemented correctly
    while (_____) {
        IntList prevAtIndex = _____;
        IntList next = _____;
        _____;
        _____;
        L = _____;
        index -= 1;
        if (_____) {
            _____;
        }
    }
    return array;
}
```

2 Interweave

```
public static IntList[] interweave(IntList lst, int k) {
    IntList[] array = new IntList[k];
    int index = k - 1;
    IntList L = reverse(lst); // Assume reverse is implemented correctly
    while (L != null) {
        IntList prevAtIndex = _____;
        IntList next = _____;
        _____;
        _____;
        L = _____;
        index -= 1;
        if (_____) {
            _____;
        }
    }
    return array;
}
```

2 Interweave

```
public static IntList[] interweave(IntList lst, int k) {
    IntList[] array = new IntList[k];
    int index = k - 1;
    IntList L = reverse(lst); // Assume reverse is implemented correctly
    while (L != null) {
        IntList prevAtIndex = array[index];
        IntList next = _____;
        _____;
        _____;
        L = _____;
        index -= 1;
        if (_____) {
            _____;
        }
    }
    return array;
}
```

2 Interweave

```
public static IntList[] interweave(IntList lst, int k) {
    IntList[] array = new IntList[k];
    int index = k - 1;
    IntList L = reverse(lst); // Assume reverse is implemented correctly
    while (L != null) {
        IntList prevAtIndex = array[index];
        IntList next = L.rest;

        -----;
        -----;
        L = -----;
        index -= 1;
        if (-----) {
            -----;
        }
    }
    return array;
}
```

2 Interweave

```
public static IntList[] interweave(IntList lst, int k) {
    IntList[] array = new IntList[k];
    int index = k - 1;
    IntList L = reverse(lst); // Assume reverse is implemented correctly
    while (L != null) {
        IntList prevAtIndex = array[index];
        IntList next = L.rest;
        array[index] = L;

        -----;
        L = -----;
        index -= 1;
        if (-----) {
            -----;
        }
    }
    return array;
}
```

2 Interweave

```
public static IntList[] interweave(IntList lst, int k) {
    IntList[] array = new IntList[k];
    int index = k - 1;
    IntList L = reverse(lst); // Assume reverse is implemented correctly
    while (L != null) {
        IntList prevAtIndex = array[index];
        IntList next = L.rest;
        array[index] = L;
        array[index].rest = prevAtIndex;
        L = _____;
        index -= 1;
        if (_____) {
            _____;
        }
    }
    return array;
}
```

2 Interweave

```
public static IntList[] interweave(IntList lst, int k) {
    IntList[] array = new IntList[k];
    int index = k - 1;
    IntList L = reverse(lst); // Assume reverse is implemented correctly
    while (L != null) {
        IntList prevAtIndex = array[index];
        IntList next = L.rest;
        array[index] = L;
        array[index].rest = prevAtIndex;
        L = next;
        index -= 1;
        if (_____) {
            _____;
        }
    }
    return array;
}
```

2 Interweave

```
public static IntList[] interweave(IntList lst, int k) {
    IntList[] array = new IntList[k];
    int index = k - 1;
    IntList L = reverse(lst); // Assume reverse is implemented correctly
    while (L != null) {
        IntList prevAtIndex = array[index];
        IntList next = L.rest;
        array[index] = L;
        array[index].rest = prevAtIndex;
        L = next;
        index -= 1;
        if (index < 0) {
            -----;
        }
    }
    return array;
}
```

2 Interweave

```
public static IntList[] interweave(IntList lst, int k) {
    IntList[] array = new IntList[k];
    int index = k - 1;
    IntList L = reverse(lst); // Assume reverse is implemented correctly
    while (L != null) {
        IntList prevAtIndex = array[index];
        IntList next = L.rest;
        array[index] = L;
        array[index].rest = prevAtIndex;
        L = next;
        index -= 1;
        if (index < 0) {
            index = k - 1;
        }
    }
    return array;
}
```

3 Remove Duplicates

Using the simplified `DLList` class, implement the `removeDuplicates` method.

`removeDuplicates` should remove all duplicate items from the `DLList`. For example, if our initial list `[8, 4, 4, 6, 4, 10, 12, 12]`, our final list should be `[8, 4, 6, 10, 12]`. You may *not* assume that duplicate items are grouped together, or that the list is sorted!

```
public class DLList {
    Node sentinel;

    public DLList() {
        // ...
    }

    public class Node {
        int item;
        Node prev;
        Node next;
    }
}
```

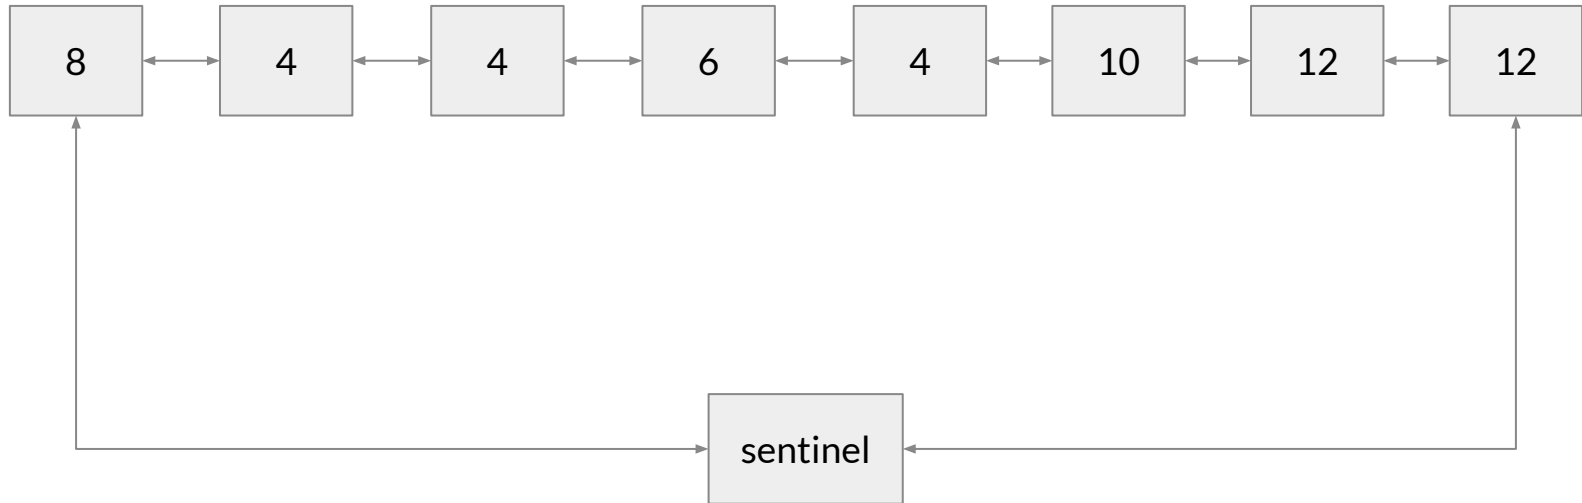

3 Remove Duplicates

```
Node ref = _____;
Node checker;
while (_____) {
    checker = _____;
    while (_____) {
        if (_____) {
            Node checkerPrev = checker.prev;
            Node checkerNext = checker.next;

            _____;
            _____;
        }
        checker = _____;
    }
    ref = _____;
}
```
